Introduction Structural Equation Modeling 2. parameters, such as factor loadings and regression coefficients. A recent development is software that allows the researchers to specify the model directly as a path diagram. This works well with simple problems, but may get tedious with more complicated models.

â€¢Structural equation modeling encompasses a broad array of models from linear regression to measurement models to simultaneous equations. â€¢Structural equation modeling is not just an estimation method for a particular model. â€¢Structural equation modeling is a way of thinking, a way of writing, and a way of estimating. -Stata SEM Manual, pg 2.

The central idea of structural equation modeling is the study of causal relationship between variables. For example, you have an X and an Y variable.X is the cause of Y, or doing X results in Y. To give a more realistic example: eating more vegetables (X) brings down your cholesterol level (Y).

Structural equation modeling (SEM) is a comprehensive statistical approach to testing hypotheses about relations among observed and latent variables (Hoyle, 1995). It is a methodology for representing, estimating, and testing a theoretical network of (mostly) linear relations between variables (Rigdon, 1998).

300 F Chapter 17: Introduction to Structural Equation Modeling with Latent Variables. Complicated models are often easier to understand when they are expressed as path diagrams. One advantage of path diagrams over equations is that variances and covariances can be shown directly in the path diagram.
