Magnetic resonance imaging (MRI) is a medical imaging technique used in radiology to form pictures of the anatomy and the physiological processes of the body in both health and disease. MRI scanners use strong magnetic fields, magnetic field gradients, and radio waves to generate images of the organs in the body. MRI does not involve X-rays or the use of ionizing radiation, which distinguishes ...

Magnetic resonance imaging (MRI) uses a large magnet and radio waves to look at organs and structures inside your body. Health care professionals use MRI scans to diagnose a variety of conditions, from torn ligaments to tumors.

Functional magnetic resonance imaging or functional MRI (fMRI) measures brain activity by detecting changes associated with blood flow. This technique relies on the fact that cerebral blood flow and neuronal activation are coupled. When an area of the brain is in use, blood flow to that region also increases.

Image segmentation is one of the most important tasks in medical image analysis and is often the first and the most critical step in many clinical applications. In brain MRI analysis, image segmentation is commonly used for measuring and visualizing the brain's anatomical structures, for analyzing brain changes, for delineating pathological regions, and for surgical planning and image-guided ...

MRI after Concussion Magnetic Resonance Imaging / MRI. MRI after concussion is the most sensitive of the structural tests. MRI, as its name indicates, utilizes magnetic fields to image the brain's tissue, as opposed to the X-ray radiation of the CT scan.

MRI after Concussion: Magnetic Resonance Imaging

Magnetic resonance imaging (MRI) is the diagnostic tool that currently offers the most sensitive non-invasive way of imaging the brain, spinal cord, or other areas of the body. It is the preferred imaging method to help establish a diagnosis of MS and to monitor the course of the disease. MRI has made it possible to visualize and understand much more about the underlying pathology of the disease.

MRI IS NMR RENAMED. Upon the advance of NMR (nuclear magnetic resonance) technology into its medical applications, as a result of Dr. Damadian's DISCOVERIES, the medical community preferred the

elimination of the word nuclear to avoid its radioactive connotations (that were non-existent) and the radiologic community sought to have the I added to denote NMR scanning as an imaging technology.

The fully accredited S. Mark Taper Foundation Imaging Center offers the full range of MRI studies using the latest technology and highly trained, subspecialized imaging physicians. The bore on our newest MRI scanners are 33 percent wider than older machines and are also shorter, making them even more patient friendly.

A brain tumor is a growth of abnormal cells in the tissues of the brain. Brain tumors can be benign, with no cancer cells, or malignant, with cancer cells that grow quickly.

One of the biggest concerns in radiology in recent years is the safety of gadolinium-based contrast agents (GBCAs) used in magnetic resonance imaging (MRI).Radiologists and patients began to question the safety of gadolinium a few years ago when a study came out in late 2014 showing the agent is deposited and retained in the brain.[1]

Why do we think we're so bad at maths, when we're all - almost all - born with brain circuits specialised for numbers? Our ability to use numbers has been the key from taking us from the Stone Age to the Phone Age. Trade, science and technology would be impossible without this ability. Neuroscientist Brian Butterworth argues that we are all born with brain circuits specialised for numbers.
