Modelling and Analysis of Discrete Event Simulations

Numerical modeling of column dynamics is essential to identify inputs required for atmospheric dispersal models. Numerical modeling of co-PDC plume formation and rise has typically involved the modification of models normally applied to vent-derived plumes (eg, Woods and Wohletz, 1991).

Yet analog modeling is still useful in modeling geological scenarios that are difficult to capture in numerical models, and the combination of analog and numerical modeling can be useful to improve understanding of the Earth's processes.
