A numerical method is said to be convergent if the numerical solution approaches the exact solution as the step size h goes to 0. More precisely, we require that for every ODE (1) with a Lipschitz function f and every $t^* > 0$, $\forall \epsilon > 0, \exists \delta > 0$ such that $\forall h < \delta$, $\forall t \in [0, t^*]$, $|\hat{y}_h(t) - y(t)| < \epsilon$. All the methods mentioned above are convergent.

Numerical methods John D. Fenton a pair of modules, Goal Seek and Solver, which obviate the need for much programming and computations. Goal Seek, is easy to use, but it is limited " with it one can solve a single equation, however complicated or however many spreadsheet cells are involved, whether the equation is linear or nonlinear.

The atmosphere is a fluid. As such, the idea of numerical weather prediction is to sample the state of the fluid at a given time and use the equations of fluid dynamics and thermodynamics to estimate the state of the fluid at some time in the future. The process of entering observation data into the model to generate initial conditions is called initialization.

Now, we implement our total-variation regularized differentiation, (). We use the matrix-based version described above, using $\delta \cdot \frac{1}{4} = 0.2$ and $\delta \cdot \infty = 1.0 \hat{''} 6$, initializing with the naive derivative (specifically $[0; \text{diff}(f); 0]$, to obtain a vector of the appropriate size). Although convergence is nearly complete after 100 iterations, the points closest to the jump move much more slowly ...
