Jablinski's Diagram. To properly explain the principles of fluorescent microscopy, we must give an account of the Jablinski's diagram (principles illustrated in figure 1), introduced by Alexander Jablinski in the early 1930's.

Two microscope components are of critical importance in forming the image: (1) the objective lens, which collects light diffracted by the specimen and forms a magnified real image at the real intermediate image plane near the eyepieces or oculars, and (2) the.

### **Fundamentals of Light Microscopy and Electronic Imaging**

Basic Structure and Principle of Microscopes. A telescope receives light from a star or other distant object with the objective lens and adjusts the refracted light to the focal point through the ocular lens. On the other hand, a microscope is designed to emit light onto or through objects and magnify the transmitted or reflected light with the objective and ocular lenses.

• The focal point of the objective lens in a microscope is reformed into a •conjugate• focal plane close to the detection system. • By inserting an aperture diaphragm (Pinhole) in this conjugate focal plane, we can obstruct fluorescence emission from planes OUTSIDE of the primary focus point.
